# LM2678 SIMPLE SWITCHER ${ }^{\circledR}$ High Efficiency 5-A Step-Down Voltage Regulator 

## 1 Features

- Efficiency Up to $92 \%$
- Simple and Easy to Design Using Off-the-Shelf External Components
- $120-\mathrm{m} \Omega$ DMOS Output Switch
- 3.3-V, $5-\mathrm{V}$, and $12-\mathrm{V}$ Fixed Output and Adjustable (1.2 V to 37 V ) Versions
- $50-\mu \mathrm{A}$ Standby Current When Switched OFF
- $\pm 2 \%$ Maximum Output Tolerance Over Full Line and Load Conditions
- Wide Input Voltage Range: 8 V to 40 V
- $260-\mathrm{kHz}$ Fixed Frequency Internal Oscillator
- -40 to $125^{\circ} \mathrm{C}$ Operating Junction Temperature Range

## 2 Applications

- Simple-to-Design, High Efficiency (>90\%) StepDown Switching Regulators
- Efficient System Preregulator for Linear Voltage Regulators
- Battery Chargers

## 3 Description

The LM2678 series of regulators are monolithic integrated circuits which provide all of the active functions for a step-down (buck) switching regulator capable of driving up to 5 -A loads with excellent line and load regulation characteristics. High efficiency ( $>90 \%$ ) is obtained through the use of a low ONresistance DMOS power switch. The series consists of fixed output voltages of $3.3 \mathrm{~V}, 5 \mathrm{~V}$, and 12 V and an adjustable output version.
The SIMPLE SWITCHER ${ }^{\circledR}$ concept provides for a complete design using a minimum number of external components. A high fixed frequency oscillator ( 260 kHz ) allows the use of physically smaller sized components. A family of standard inductors for use with the LM2678 are available from several manufacturers to greatly simplify the design process.
The LM2678 series also has built-in thermal shutdown, current limiting, and an ON/OFF control input that can power down the regulator to a low 50$\mu \mathrm{A}$ quiescent current standby condition. The output voltage is ensured to a $\pm 2 \%$ tolerance. The clock frequency is controlled to within a $\pm 11 \%$ tolerance.

| Device Information $^{(1)}$ |  |  |
| :---: | :--- | :--- |
| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| LM2678 | TO-263 $(7)$ | $10.10 \mathrm{~mm} \times 8.89 \mathrm{~mm}$ |
|  | TO-220 $(7)$ | $14.986 \mathrm{~mm} \times 10.16 \mathrm{~mm}$ |
|  | VSON $(14)$ | $6.00 \mathrm{~mm} \times 5.00 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)(2)}$

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
(3) The absolute maximum specification of the Switch Voltage to Ground applies to DC voltage. An extended negative voltage limit of -10 V applies to a pulse of up to $20 \mathrm{~ns},-6 \mathrm{~V}$ of 60 ns and -3 V of up to 100 ns .

### 6.2 ESD Ratings

|  |  |  | VALUE |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{(\mathrm{ESD})}$ | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)(2)}$ | $\pm 2000$ |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) ESD was applied using the human-body model, a 100-pF capacitor discharged through a $1.5-\mathrm{k} \Omega$ resistor into each pin.

### 6.3 Recommended Operating Conditions

|  | MIN | MAX |
| :--- | ---: | ---: |
| Uupply voltage | 8 | 40 |
| Junction temperature, $T_{J}$ | -40 | 125 |

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.
(2) Junction to ambient thermal resistance (no external heat sink) for the 7 -lead TO-220 package mounted vertically, with $1 / 2$ inch leads in a socket, or on a PCB with minimum copper area.
(3) Junction to ambient thermal resistance (no external heat sink) for the 7-lead TO-220 package mounted vertically, with $1 / 2$ inch leads soldered to a PCB containing approximately 4 square inches of (1 oz.) copper area surrounding the leads.
(4) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB area of 0.136 square inches (the same size as the DDPAK package) of 1 oz . ( 0.0014 in. thick) copper.
(5) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB area of 0.4896 square inches (3.6 times the area of the DDPAK package) of 1 oz . ( 0.0014 in . thick) copper.
(6) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB copper area of 1.0064 square inches ( 7.4 times the area of the DDPAK 3 package) of 1 oz . ( 0.0014 in . thick) copper. Additional copper area reduces thermal resistance further.
(7) Junction to ambient thermal resistance for the 14-lead VSON mounted on a PCB copper area equal to the die attach paddle.
(8) Junction to ambient thermal resistance for the 14-lead VSON mounted on a PCB copper area using 12 vias to a second layer of copper equal to die attach paddle. Additional copper area will reduce thermal resistance further. For layout recommendations, see $A N-1187$ Leadless Leadfram Package (LLP).

### 6.5 Electrical Characteristics - 3.3 V

Specifications apply for $T_{A}=T_{J}=25^{\circ} \mathrm{C}$ and $\mathrm{R}_{A D J}=5.6 \mathrm{k} \Omega$ (unless otherwise noted).

|  | PARAMETER | TEST CONDITIONS |  | MIN ${ }^{(1)}$ | TYP ${ }^{(2)}$ | MAX ${ }^{(1)}$ | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {OUT }}$ | Output voltage | $\begin{aligned} & \mathrm{V}_{\mathrm{IN}}=8 \mathrm{~V} \text { to } 40 \mathrm{~V}, \\ & 100 \mathrm{~mA} \leq \mathrm{I}_{\text {OUT }} \leq 5 \mathrm{~A} \end{aligned}$ | $\mathrm{T}_{\mathrm{J}}=25^{\circ} \mathrm{C}$ | 3.234 | 3.3 | 3.366 | V |
|  |  |  | $\mathrm{T}_{\mathrm{J}}=-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | 3.201 |  | 3.399 |  |
| $\eta$ | Efficiency | $\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{I}_{\text {LOAD }}=5 \mathrm{~A}$ |  | 82\% |  |  |  |

(1) All room temperature limits are $100 \%$ tested during production with $T_{A}=T_{J}=25^{\circ} \mathrm{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
(2) Typical values are determined with $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{J}=25^{\circ} \mathrm{C}$ and represent the most likely norm.

### 6.6 Electrical Characteristics - 5 V

Specifications apply for $T_{A}=T_{J}=25^{\circ} \mathrm{C}$ and $R_{A D J}=5.6 \mathrm{k} \Omega$ (unless otherwise noted).

| PARAMETER | TEST CONDITIONS |  | MIN $^{(1)}$ | TYP ${ }^{(2)}$ | MAX ${ }^{(1)}$ |

|  |  | $T_{J}=-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | 4.85 |  |  |
| $\eta$ | Efficiency | $\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V}, \mathrm{I}_{\text {LOAD }}=5 \mathrm{~A}$ | 5.15 | V |  |

(1) All room temperature limits are $100 \%$ tested during production with $T_{A}=T_{J}=25^{\circ} \mathrm{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
(2) Typical values are determined with $T_{A}=T_{J}=25^{\circ} \mathrm{C}$ and represent the most likely norm.

### 6.7 Electrical Characteristics - 12 V

Specifications apply for $T_{A}=T_{J}=25^{\circ} \mathrm{C}$ and $R_{A D J}=5.6 \mathrm{k} \Omega$ (unless otherwise noted).

|  | PARAMETER | TEST CONDITIONS |  | MIN ${ }^{(1)}$ | TYP ${ }^{(2)}$ | MAX ${ }^{(1)}$ | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {OUT }}$ | Output voltage | $\begin{aligned} & \mathrm{V}_{\text {IN }}=15 \mathrm{~V} \text { to } 40 \mathrm{~V}, \\ & 100 \mathrm{~mA} \leq \mathrm{I}_{\text {OUT }} \leq 5 \mathrm{~A} \end{aligned}$ | $\mathrm{T}_{\mathrm{J}}=25^{\circ} \mathrm{C}$ | 11.76 | 12 | 12.24 | V |
|  |  |  | $\mathrm{T}_{\mathrm{J}}=-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | 11.64 |  | 12.36 |  |
| $\eta$ | Efficiency | $\mathrm{V}_{\mathrm{IN}}=24 \mathrm{~V}, \mathrm{I}_{\text {LOAD }}=5 \mathrm{~A}$ |  | 92\% |  |  |  |

(1) All room temperature limits are $100 \%$ tested during production with $T_{A}=T_{J}=25^{\circ} \mathrm{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
(2) Typical values are determined with $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{J}=25^{\circ} \mathrm{C}$ and represent the most likely norm.

### 6.8 Electrical Characteristics - Adjustable

Specifications apply for $T_{A}=T_{J}=25^{\circ} \mathrm{C}$ and $R_{A D J}=5.6 \mathrm{k} \Omega$ (unless otherwise noted).

|  | PARAMETER | TEST CONDITIONS |  | MIN ${ }^{(1)}$ | TYP ${ }^{(2)}$ | MAX ${ }^{(1)}$ | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {FB }}$ | Feedback voltage | $\mathrm{V}_{\mathrm{IN}}=8 \mathrm{~V}$ to 40 V , | $\mathrm{T}_{\mathrm{J}}=25^{\circ} \mathrm{C}$ | 1.186 | 1.21 | 1.234 | V |
|  |  | $100 \mathrm{~mA} \leq \mathrm{I}_{\text {OUT }} \leq 5 \mathrm{~A}$ <br> $\mathrm{V}_{\text {OUT }}$ programmed for 5 V | $\mathrm{T}_{J}=-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | 1.174 |  | 1.246 |  |
| $\eta$ | Efficiency | $\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{I}_{\text {LOAD }}=5 \mathrm{~A}$ |  | 84\% |  |  |  |

(1) All room temperature limits are $100 \%$ tested during production with $T_{A}=T_{J}=25^{\circ} \mathrm{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
(2) Typical values are determined with $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{J}=25^{\circ} \mathrm{C}$ and represent the most likely norm.

### 6.9 Electrical Characteristics - All Output Voltage Versions

Specifications are for $T_{A}=T_{J}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathbb{I N}}=12 \mathrm{~V}$ for the $3.3-\mathrm{V}, 5-\mathrm{V}$, and adjustable versions, and $\mathrm{V}_{\mathbb{I N}}=24 \mathrm{~V}$ for the $12-\mathrm{V}$ version (unless otherwise noted).

|  | PARAMETER | TEST CONDITIONS |  | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{I}_{\mathrm{Q}}$ | Quiescent current | $\mathrm{V}_{\text {FEEDBACK }}=8 \mathrm{~V}$ for 3.3-V, 5-V, and adjustable versions, <br> $\mathrm{V}_{\text {FEEDBACK }}=15 \mathrm{~V}$ for $12-\mathrm{V}$ version |  |  | 4.2 | 6 | mA |
| $\mathrm{I}_{\text {StBY }}$ | Standby quiescent current | ON/OFF pin $=0 \mathrm{~V}$ | $\mathrm{T}_{\mathrm{J}}=25^{\circ} \mathrm{C}$ |  | 50 | 100 | $\mu \mathrm{A}$ |

## 7 Detailed Description

### 7.1 Overview

The LM2678 provides all of the active functions required for a step-down (buck) switching regulator. The internal power switch is a DMOS power MOSFET to provide power supply designs with high current capability, up to 5 A, and highly efficient operation.
The LM2678 is part of the SIMPLE SWITCHER ${ }^{\circledR}$ family of power converters. The design support WEBENCH, can also be used to provide instant component selection, circuit performance calculations for evaluation, a bill of materials component list and a circuit schematic for LM2678.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Switch Output

This is the output of a power MOSFET switch connected directly to the input voltage. The switch provides energy to an inductor, an output capacitor and the load circuitry under control of an internal pulse-width-modulator (PWM). The PWM controller is internally clocked by a fixed $260-\mathrm{kHz}$ oscillator. In a standard step-down application the duty cycle (Time ON/Time OFF) of the power switch is proportional to the ratio of the power supply output voltage to the input voltage. The voltage on pin 1 switches between Vin (switch ON) and below ground by the voltage drop of the external Schottky diode (switch OFF).

## Feature Description (continued)

### 7.3.2 Input

The input voltage for the power supply is connected to pin 2 . In addition to providing energy to the load the input voltage also provides bias for the internal circuitry of the LM2678. For ensured performance the input voltage must be in the range of 8 V to 40 V . For best performance of the power supply the input pin must always be bypassed with an input capacitor located close to pin 2.

### 7.3.3 C Boost

A capacitor must be connected from pin 3 to the switch output, pin 1. This capacitor boosts the gate drive to the internal MOSFET above $\mathrm{V}_{\text {IN }}$ to fully turn it ON . This minimizes conduction losses in the power switch to maintain high efficiency. The recommended value for C Boost is $0.01 \mu \mathrm{~F}$.

### 7.3.4 Ground

This is the ground reference connection for all components in the power supply. In fast-switching, high-current applications such as those implemented with the LM2678, TI recommends that a broad ground plane be used to minimize signal coupling throughout the circuit.

### 7.3.5 Feedback

This is the input to a two-stage high gain amplifier, which drives the PWM controller. It is necessary to connect pin 6 to the actual output of the power supply to set the DC output voltage. For the fixed output devices (3.3-V,5V and $12-\mathrm{V}$ outputs), a direct wire connection to the output is all that is required as internal gain setting resistors are provided inside the LM2678. For the adjustable output version two external resistors are required to set the DC output voltage. For stable operation of the power supply it is important to prevent coupling of any inductor flux to the feedback input.

### 7.3.6 ON/OFF

This input provides an electrical ON/OFF control of the power supply. Connecting this pin to ground or to any voltage less than 0.8 V is completely turn OFF the regulator. The current drain from the input supply when OFF is only $50 \mu \mathrm{~A}$. Pin 7 has an internal pullup current source of approximately $20 \mu \mathrm{~A}$ and a protection clamp Zener diode of 7 V to ground. When electrically driving the ON/OFF pin the high voltage level for the ON condition should not exceed the 6 V absolute maximum limit. When ON/OFF control is not required pin 7 should be left open circuited.

### 7.4 Device Functional Modes

### 7.4.1 Shutdown Mode

The ON/OFF pin provides electrical ON and OFF control for the LM2678. When the voltage of this pin is lower than 1.4 V , the device enters shutdown mode. The typical standby current in this mode is $45 \mu \mathrm{~A}$.

### 7.4.2 Active Mode

When the voltage of the ON/OFF pin is higher than 1.4 V , the device starts switching and the output voltage rises until it reaches a normal regulation voltage.

## 8 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

### 8.1.1 Design Considerations

Power supply design using the LM2678 is greatly simplified by using recommended external components. A wide range of inductors, capacitors, and Schottky diodes from several manufacturers have been evaluated for use in designs that cover the full range of capabilities (input voltage, output voltage, and load current) of the LM2678. A simple design procedure using nomographs and component tables provided in this data sheet leads to a working design with very little effort.
The individual components from the various manufacturers called out for use are still just a small sample of the vast array of components available in the industry. While these components are recommended, they are not exclusively the only components for use in a design. After a close comparison of component specifications, equivalent devices from other manufacturers could be substituted for use in an application.
Important considerations for each external component and an explanation of how the nomographs and selection tables were developed follows.

### 8.1.2 Inductor

The inductor is the key component in a switching regulator. For efficiency the inductor stores energy during the switch ON time and then transfers energy to the load while the switch is OFF.
Nomographs are used to select the inductance value required for a given set of operating conditions. The nomographs assume that the circuit is operating in continuous mode (the current flowing through the inductor never falls to zero). The magnitude of inductance is selected to maintain a maximum ripple current of $30 \%$ of the maximum load current. If the ripple current exceeds this $30 \%$ limit the next larger value is selected.
The inductors offered have been specifically manufactured to provide proper operation under all operating conditions of input and output voltage and load current. Several part types are offered for a given amount of inductance. Both surface mount and through-hole devices are available. The inductors from each of the three manufacturers have unique characteristics.

- Renco: ferrite stick core inductors; benefits are typically lowest cost and can withstand ripple and transient peak currents above the rated value. These inductors have an external magnetic field, which may generate EMI.
- Pulse Engineering: powdered iron toroid core inductors; these also can withstand higher than rated currents and, being toroid inductors, have low EMI.
- Coilcraft: ferrite drum core inductors; these are the smallest physical size inductors and are available only as surface mount components. These inductors also generate EMI but less than stick inductors.

### 8.1.3 Output Capacitor

The output capacitor acts to smooth the DC output voltage and also provides energy storage. Selection of an output capacitor, with an associated equivalent series resistance (ESR), impacts both the amount of output ripple voltage and stability of the control loop.
The output ripple voltage of the power supply is the product of the capacitor ESR and the inductor ripple current. The capacitor types recommended in the tables were selected for having low ESR ratings.
In addition, both surface mount tantalum capacitors and through-hole aluminum electrolytic capacitors are offered as solutions.

## Application Information (continued)

Impacting frequency stability of the overall control loop, the output capacitance, in conjunction with the inductor, creates a double pole inside the feedback loop. In addition the capacitance and the ESR value create a zero. These frequency response effects together with the internal frequency compensation circuitry of the LM2678 modify the gain and phase shift of the closed-loop system.
As a general rule for stable switching regulator circuits it is desired to have the unity gain bandwidth of the circuit to be limited to no more than one-sixth of the controller switching frequency. With the fixed $260-\mathrm{kHz}$ switching frequency of the LM2678, the output capacitor is selected to provide a unity gain bandwidth of 40 kHz maximum. Each recommended capacitor value has been chosen to achieve this result.

In some cases multiple capacitors are required either to reduce the ESR of the output capacitor, to minimize output ripple (a ripple voltage of $1 \%$ of $\mathrm{V}_{\text {Out }}$ or less is the assumed performance condition), or to increase the output capacitance to reduce the closed loop unity gain bandwidth (to less than 40 kHz ). When parallel combinations of capacitors are required it has been assumed that each capacitor is the exact same part type.
The RMS current and working voltage (WV) ratings of the output capacitor are also important considerations. In a typical step-down switching regulator, the inductor ripple current (set to be no more than $30 \%$ of the maximum load current by the inductor selection) is the current that flows through the output capacitor. The capacitor RMS current rating must be greater than this ripple current. The voltage rating of the output capacitor should be greater than 1.3 times the maximum output voltage of the power supply. If operation of the system at elevated temperatures is required, the capacitor voltage rating may be de-rated to less than the nominal room temperature rating. Careful inspection of the manufacturer's specification for de-rating of working voltage with temperature is important.

### 8.1.4 Input Capacitor

Fast changing currents in high current switching regulators place a significant dynamic load on the unregulated power source. An input capacitor helps to provide additional current to the power supply as well as smooth out input voltage variations.

Like the output capacitor, the key specifications for the input capacitor are RMS current rating and working voltage. The RMS current flowing through the input capacitor is equal to one-half of the maximum DC load current so the capacitor should be rated to handle this. Paralleling multiple capacitors proportionally increases the current rating of the total capacitance. The voltage rating should also be selected to be 1.3 times the maximum input voltage. Depending on the unregulated input power source, under light load conditions the maximum input voltage could be significantly higher than normal operation and should be considered when selecting an input capacitor.
The input capacitor must be placed very close to the input pin of the LM2678. Due to relative high current operation with fast transient changes, the series inductance of input connecting wires or PCB traces can create ringing signals at the input terminal which could possibly propagate to the output or other parts of the circuitry. It may be necessary in some designs to add a small valued ( $0.1 \mu \mathrm{~F}$ to $0.47 \mu \mathrm{~F}$ ) ceramic type capacitor in parallel with the input capacitor to prevent or minimize any ringing.

### 8.1.5 Catch Diode

When the power switch in the LM2678 turns OFF, the current through the inductor continues to flow. The path for this current is through the diode connected between the switch output and ground. This forward biased diode clamps the switch output to a voltage less than ground. This negative voltage must be greater than -1 V so a low voltage drop (particularly at high current levels) Schottky diode is recommended. Total efficiency of the entire power supply is significantly impacted by the power lost in the output catch diode. The average current through the catch diode is dependent on the switch duty cycle ( D ) and is equal to the load current times (1-D). Use of a diode rated for much higher current than is required by the actual application helps to minimize the voltage drop and power loss in the diode.
During the switch ON time the diode will be reversed biased by the input voltage. The reverse voltage rating of the diode must be at least 1.3 times greater than the maximum input voltage.

## Application Information (continued)

### 8.1.6 Boost Capacitor

The boost capacitor creates a voltage used to overdrive the gate of the internal power MOSFET. This improves efficiency by minimizing the ON-resistance of the switch and associated power loss. For all applications it is recommended to use a $0.01-\mu \mathrm{F}, 50-\mathrm{V}$ ceramic capacitor.

### 8.1.7 Additional Application Information

When the output voltage is greater than approximately 6 V , and the duty cycle at minimum input voltage is greater than approximately $50 \%$, the designer should exercise caution in selection of the output filter components. When an application designed to these specific operating conditions is subjected to a current limit fault condition, it may be possible to observe a large hysteresis in the current limit. This can affect the output voltage of the device until the load current is reduced sufficiently to allow the current limit protection circuit to reset itself.
Under current limiting conditions, the LM267x is designed to respond in the following manner:

1. At the moment when the inductor current reaches the current limit threshold, the ON-pulse is immediately terminated. This happens for any application condition.
2. However, the current limit block is also designed to momentarily reduce the duty cycle to below $50 \%$ to avoid subharmonic oscillations, which could cause the inductor to saturate.
3. Thereafter, once the inductor current falls below the current limit threshold, there is a small relaxation time during which the duty cycle progressively rises back above $50 \%$ to the value required to achieve regulation.
If the output capacitance is sufficiently large, it may be possible that as the output tries to recover, the output capacitor charging current is large enough to repeatedly re-trigger the current limit circuit before the output has fully settled. This condition is exacerbated with higher output voltage settings because the energy requirement of the output capacitor varies as the square of the output voltage ( $1 / 2 \mathrm{CV}^{2}$ ), thus requiring an increased charging current.

A simple test to determine if this condition might exist for a suspect application is to apply a short circuit across the output of the converter, and then remove the shorted output condition. In an application with properly selected external components, the output will recover smoothly.
Practical values of external components that have been experimentally found to work well under these specific operating conditions are $\mathrm{C}_{\text {OUt }}=47 \mu \mathrm{~F}, \mathrm{~L}=22 \mu \mathrm{H}$. It should be noted that even with these components, for a device's current limit of $\mathrm{I}_{\text {CLIM }}$, the maximum load current under which the possibility of the large current limit hysteresis can be minimized is $\mathrm{I}_{\text {cLIM }} / 2$. For example, if the input is 24 V and the set output voltage is 18 V , then for a desired maximum current of 1.5 A , the current limit of the chosen switcher must be confirmed to be at least 3 A.
Under extreme overcurrent or short circuit conditions, the LM267X employs frequency foldback in addition to the current limit. If the cycle-by-cycle inductor current increases above the current limit threshold (due to short circuit or inductor saturation for example) the switching frequency is automatically reduced to protect the IC. Frequency below 100 kHz is typical for an extreme short-circuit condition.

### 8.2 Typical Application

### 8.2.1 All Output Voltage Versions

Figure 16. Typical Application for All Output Voltage Versions

## Typical Application (continued)

### 8.2.1.1 Design Requirements

Select the power supply operating conditions and the maximum output current and follow below procedures to find the external components for LM2678.

### 8.2.1.2 Detailed Design Procedure

Using the nomographs and tables in this data sheet (or use the available design software at www.ti.com) a complete step-down regulator can be designed in a few simple steps.
Step 1: Define the power supply operating conditions:

- Required output voltage
- Maximum DC input voltage
- Maximum output load current

Step 2: Set the output voltage by selecting a fixed output LM2678 (3.3-V, $5-\mathrm{V}$, or $12-\mathrm{V}$ applications) or determine the required feedback resistors for use with the adjustable LM2678-ADJ
Step 3: Determine the inductor required by using one of the four nomographs, Figure 17 through Figure 20. Table 3 provides a specific manufacturer and part number for the inductor.
Step 4: Using Table 5 (fixed output voltage) or Table 9 (adjustable output voltage), determine the output capacitance required for stable operation. Table 1 provides the specific capacitor type from the manufacturer of choice.

Step 5: Determine an input capacitor from Table 5 for fixed output voltage applications. Use Table 1 to find the specific capacitor type. For adjustable output circuits select a capacitor from Table 1 with a sufficient working voltage (WV) rating greater than $\mathrm{V}_{\mathbb{N}}$ max, and an RMS current rating greater than one-half the maximum load current ( 2 or more capacitors in parallel may be required).
Step 6: Select a diode from Table 4. The current rating of the diode must be greater than $\mathrm{I}_{\text {LOAD }}$ max and the reverse voltage rating must be greater than $\mathrm{V}_{\mathrm{IN}}$ maximum.
Step 7: Include a $0.01-\mu \mathrm{F}, 50-\mathrm{V}$ capacitor for $\mathrm{C}_{\text {BOost }}$ in the design.

### 8.2.2 Fixed Output Voltage Design Example

Figure 21. Basic Circuit for Fixed Output Voltage Applications

### 8.2.2.1 Detailed Design Procedure

A system logic power supply bus of 3.3 V is to be generated from a wall adapter which provides an unregulated DC voltage of 13 V to 16 V . The maximum load current is 4 A . Through-hole components are preferred.

Step 1: Operating conditions are:

- $\mathrm{V}_{\text {OUt }}=3.3 \mathrm{~V}$
- $\mathrm{V}_{\mathbb{I N}} \max =16 \mathrm{~V}$
- I Load max $=4 \mathrm{~A}$

Step 2: Select a LM2678 3.3-V. The output voltage has a tolerance of $\pm 2 \%$ at room temperature and $\pm 3 \%$ over the full operating temperature range.
Step 3: Use the nomograph for the 3.3-V device, Figure 17. The intersection of the 16-V horizontal line ( $\mathrm{V}_{\text {in }}$ max) and the 4-A vertical line (load max) indicates that L 46 , a $15-\mu \mathrm{H}$ inductor, is required.

From Table 3, L46 in a through-hole component is available from Renco with part number RL-1283-15-43.
Step 4: Use Table 5 to determine an output capacitor. With a 3.3-V output and a $15-\mu \mathrm{H}$ inductor there are four through-hole output capacitor solutions with the number of same type capacitors to be paralleled and an identifying capacitor code given. Table 1 provides the actual capacitor characteristics. Any of the following choices work in the circuit:

- $2 \times 220-\mu \mathrm{F}, 10-\mathrm{V}$ Sanyo OS-CON (code C5)
- $2 \times 820-\mu \mathrm{F}, 16-\mathrm{V}$ Sanyo MV-GX (code C5)
- $1 \times 3900-\mu \mathrm{F}, 10-\mathrm{V}$ Nichicon PL (code C7)
- $2 \times 560-\mu \mathrm{F}, 35-\mathrm{V}$ Panasonic HFQ (code C5)

Step 5: Use Table 5 to select an input capacitor. With $3.3-\mathrm{V}$ output and $15 \mu \mathrm{H}$ there are three through-hole solutions. These capacitors provide a sufficient voltage rating and an RMS current rating greater than 2 A (1/2 $\mathrm{I}_{\text {load }} \mathrm{max}$ ). Again using Table 1 for specific component characteristics the following choices are suitable:

- $2 \times 680-\mu \mathrm{F}, 63-\mathrm{V}$ Sanyo MV-GX (code C13)
- $1 \times 1200-\mu \mathrm{F}, 63-\mathrm{V}$ Nichicon PL (code C25)
- $1 \times 1500-\mu \mathrm{F}, 63$-V Panasonic HFQ (code C16)

Step 6: From Table 4 a 5-A or more Schottky diode must be selected. For through-hole components only 40-V rated diodes are indicated and 4 part types are suitable:

- 1N5825
- MBR745
- 80SQ045
- 6TQ045

Step 7: A $0.01-\mu \mathrm{F}$ capacitor is used for $\mathrm{C}_{\text {Boost }}$.

LM2678

### 8.2.3 Adjustable Output Design Example

Figure 22. Basic Circuit for Adjustable Output Voltage Applications

### 8.2.3.1 Detailed Design Procedure

In this example it is desired to convert the voltage from a two battery automotive power supply (voltage range of 20 V to 28 V , typical in large truck applications) to the 14.8-VDC alternator supply typically used to power electronic equipment from single battery $12-\mathrm{V}$ vehicle systems. The load current required is 3.5 A maximum. It is also desired to implement the power supply with all surface mount components.
Step 1: Operating conditions are:

- $\mathrm{V}_{\text {OUT }}=14.8 \mathrm{~V}$
- $\mathrm{V}_{\mathrm{IN}} \max =28 \mathrm{~V}$
- I Load max $=3.5 \mathrm{~A}$

Step 2: Select an LM2678S-ADJ. To set the output voltage to 14.9-V two resistors need to be chosen (R1 and R2 in Figure 22). For the adjustable device the output voltage is set by Equation 1.
$V_{\text {OUT }}=V_{\text {FB }}\left(1+\frac{R_{2}}{R_{1}}\right)$
where

- $\mathrm{V}_{F B}$ is the feedback voltage of typically 1.21 V

A recommended value to use for R 1 is 1 k . In this example then R 2 is determined with Equation 2.
$R_{2}=R_{1}\left(\frac{V_{\text {OUT }}}{V_{F B}}-1\right)=1 \mathrm{k} \Omega\left(\frac{14.8 \mathrm{~V}}{1.21 \mathrm{~V}}-1\right)$
where

$$
\begin{equation*}
\text { - } \mathrm{R} 2=11.23 \mathrm{k} \Omega \tag{2}
\end{equation*}
$$

The closest standard $1 \%$ tolerance value to use is $11.3 \mathrm{k} \Omega$.
This sets the nominal output voltage to 14.88 V which is within $0.5 \%$ of the target value.
Step 3: To use the nomograph for the adjustable device, Figure 20, requires a calculation of the inductor Volt microsecond constant ( $\mathrm{E} \cdot \mathrm{T}$ expressed in $\mathrm{V} \cdot \mu \mathrm{S}$ ) from Equation 3.

$$
E \cdot T=\left(V_{\text {IN (MAX) }}-V_{\text {OUT }}-V_{S A T}\right) \cdot \frac{V_{\text {OUT }}+V_{D}}{V_{\text {IN (MAX })}-V_{S A T}+V_{D}} \cdot \frac{1000}{260}(V \cdot \mu \mathrm{~s})
$$

where

- $\mathrm{V}_{\text {SAT }}$ is the voltage drop across the internal power switch which is $\mathrm{R}_{\mathrm{ds}(O N)}$ times $\mathrm{I}_{\text {load }}$

In this example this would be typically $0.12 \Omega \times 3.5 \mathrm{~A}$ or 0.42 V and $\mathrm{V}_{\mathrm{D}}$ is the voltage drop across the forward biased Schottky diode, typically 0.5 V . The switching frequency of 260 kHz is the nominal value to use to estimate the ON time of the switch during which energy is stored in the inductor.
For this example, $\mathrm{E} \cdot \mathrm{T}$ is found with Equation 4 and Equation 5.

$$
\begin{align*}
& E \cdot T=(28-14.8-0.42) \cdot \frac{14.8+0.5}{28-0.42+0.5} \cdot \frac{1000}{260}(V \cdot \mu \mathrm{~s})  \tag{4}\\
& E \cdot T=(12.78 \mathrm{~V}) \cdot \frac{15.3 \mathrm{~V}}{28.08 \mathrm{~V}} \cdot 3.85(\mathrm{~V} \cdot \mu \mathrm{~s})=26.8(\mathrm{~V} \cdot \mu \mathrm{~s}) \tag{5}
\end{align*}
$$

Using Figure 20 , the intersection of $27 \mathrm{~V} \cdot \mu \mathrm{~S}$ horizontally and the 3.5 A vertical line (loAD max) indicates that L 48 , a $47-\mu \mathrm{H}$ inductor, or L 49 , a $33-\mu \mathrm{H}$ inductor could be used. Either inductor will be suitable, but for this example selecting the larger inductance results in lower ripple current.
From Table 3, L48 in a surface mount component is available from Pulse Engineering with part number P0848.
Step 4: Use Table 9 to determine an output capacitor. With a $14.8-\mathrm{V}$ output the 12.5 to 15 V row is used and with a $47-\mu \mathrm{H}$ inductor there are three surface mount output capacitor solutions. Table 1 provides the actual capacitor characteristics based on the C Code number. Any of the following choices can be used:

- $1 \times 33-\mu \mathrm{F}, 20-\mathrm{V}$ AVX TPS (code C6)
- $1 \times 47-\mu \mathrm{F}, 20-\mathrm{V}$ Sprague 594 (code C8)
- $1 \times 47-\mu \mathrm{F}, 20-\mathrm{V}$ Kemet T495 (code C8)

## NOTE

When using the adjustable device in low voltage applications (less than 3-V output), if the nomograph Figure 20 selects an inductance of $22 \mu \mathrm{H}$ or less Table 9 and Table 10 do not provide an output capacitor solution. With these conditions the number of output capacitors required for stable operation becomes impractical. TI recommends using either a $33-\mu \mathrm{H}$ or $47-\mu \mathrm{H}$ inductor and the output capacitors from Table 9 and Table 10.

Step 5: An input capacitor for this example requires at least a $35-\mathrm{V}$ WV rating with an RMS current rating of 1.75 A ( $1 / 2$ lout max). Table 1 shows that C 12 , a $33-\mu \mathrm{F}, 35-\mathrm{V}$ capacitor from Sprague, has the highest voltage and current rating of the surface mount components and that two of these capacitor in parallel are adequate.

Step 6: From Table 4 a 5-A or more Schottky diode must be selected. For surface mount diodes with a margin of safety on the voltage rating one of two diodes can be used:

- MBRD1545CT
- 6TQ045S

Step 7: A $0.01-\mu \mathrm{F}$ capacitor is used for $\mathrm{C}_{\text {вооsт }}$.

## 9 Power Supply Recommendations

The LM2678 is designed to operate from an input voltage supply up to 40 V . This input supply must be well regulated and able to withstand maximum input current and maintain a stable voltage.

## 10 Layout

### 10.1 Layout Guidelines

Board layout is critical for the proper operation of switching power supplies. First, the ground plane area must be sufficient for thermal dissipation purposes. Second, appropriate guidelines must be followed to reduce the effects of switching noise. Switch mode converters are very fast switching devices. In such cases, the rapid increase of input current combined with the parasitic trace inductance generates unwanted L di/dt noise spikes. The magnitude of this noise tends to increase as the output current increases. This noise may turn into electromagnetic interference (EMI) and can also cause problems in device performance. Therefore, take care in layout to minimize the effect of this switching noise. The most important layout rule is to keep the AC current loops as small as possible. Figure 23 shows the current flow in a buck converter. The top schematic shows a dotted line which represents the current flow during the top switch ON-state. The middle schematic shows the current flow during the top switch OFF-state. The bottom schematic shows the currents referred to as AC currents. These AC currents are the most critical because they are changing in a very short time period. The dotted lines of the bottom schematic are the traces to keep as short and wide as possible. This will also yield a small loop area reducing the loop inductance. To avoid functional problems due to layout, review the PCB layout example. Best results are achieved if the placement of the LM2679 device, the bypass capacitor, the Schottky diode, RFBB, RFBT, and the inductor are placed as shown in the example. Note that, in the layout shown, R1 = RFBB and R2 = RFBT. It is also recommended to use 2-oz. copper boards or heavier to help thermal dissipation and to reduce the parasitic inductances of board traces. See AN-1229 SIMPLE SWITCHER® PCB Layout Guidelines for more information.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

### 12.1 VSON Package Devices

The LM2678 is offered in the 14-pin VSON surface mount package to allow for a significantly decreased footprint with equivalent power dissipation compared to the DDPAK. For details on mounting and soldering specifications, refer to AN-1187 Leadless Leadfram Package (LLP).

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined
Pb-Free (RoHS): Tl's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

[^2]In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis

BOTTOM SIDE OF PACKAGE

[^0]:    (1) No. represents the number of identical capacitor types to be connected in parallel.
    (2) C Code indicates the Capacitor Reference number in Table 1 and Table 2 for identifying the specific component from the manufacturer.

[^1]:    (1) No. represents the number of identical capacitor types to be connected in parallel.
    (2) C Code indicates the Capacitor Reference number in Table 1 and Table 2 for identifying the specific component from the manufacturer.
    (3) Set to a higher value for a practical design solution.

[^2]:    Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
    ${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
    ${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
    ${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
    ${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
