# IV. Button Functional Description

#### 1. SELECT Button

Used for switchover between DC & AC voltages, DC&AC Currents as well as among resistance, capacitance, buzzer continuity and diode measurements, indicated by beeping during the operation. Pressing this button can wake up the meter from sleep mode, which however will cancel the auto sleep function.

#### 2. REL Button (Relative Measurement)

With this button pressed down, current reading is set as reference value which will be subtracted from subsequent readings. Press again to exit this mode and return to normal measuring status This function is not available under frequency and duty cycle measurements.

# 3. HOLD Button (data hold)

Press this button to lock displayed values, release it to unlock this status and return to normal measuring mode.

#### 4. Hz/% Measurement

The meter can switch into Hz or % measurement with this button pressed down if currently under V/uA/mA function (also used for frequency and duty cycle selection); when Hz/% operation is finished. the meter will return to V/uA/mA status with fixed range 400mA for DCV or 4V for ACV and meanwhile "AUTO" icon on LCD

disappears. If high voltage is under test at the moment, set rotary switch to desired range or turn the meter off to reset auto-ranging for V/uA/mA function before starting the measurement.

Under Hz/% mode, press down Hz/% button to switch between frequency and duty cycle measurements

# V. Operating Instructions

Switch on the meter to check if there is 🛱 icon on the LCD, if any, it indicates the power supply falls low. To ensure high accuracy for measurement, please change batteries. You should also take notice of A warnings, which indicates not to exceed maximum input limit when measuring voltage.

# 1. Measuring DC Voltage(See Figure 2)

- (1) Set rotary switch to V position, AUTO and DC icons appear on LCD; (2) Connect test leads to the power under test (Black to cathode, red to anode):
- (3) Read measuring results displayed on LCD;
- (4) Reverse test leads, then LCD will display negative readings.

# 2. Measuring AC Voltage (See Figure 2)

- (1) Set rotary switch to V position and press SELECT button, then LCD will display AUTO, AC icons;
- (2) Connect test leads to the power under test (Black to cathode, red To anode); -(**•**-)-
- (3) Read measuring values indicated on LCD;
- (4) If reversing rest lead connection, LCD will indicate negative readings.

### $\triangle$ Warnings:

- To avoid electric shock use extreme
- caution when measuring high voltage. • Disconnect test leads with measured
- circuits after finishing all the operations
- 3. Measuring Resistance(See Figure 3)
- (1) Set rotary switch to  $\Omega \cdot \eta \neq -1$  position:
- (2) Connect test leads to the resistor under test:
- (3) Read measured results on the LCD.

# A Warnings:

- Please ensure to turn off the power and discharge all capacitors before measuring online resistor so as to avoid meter damage.
- As for resistance 400 Ω range measurement test leads will cause error  $0.1 \Omega \simeq 0.3 \Omega$  to readings. In order to get accurate readings, the final results should subtract the value when two test leads short circuit. It is suggested performing the operation under relative measurement mode.
- The meter should display "OL" if no signal is input, for instance, open circuit.
- For measurement  $\geq$  1M  $\Omega$ , it normally takes several seconds to get stable readings

#### 4. Measuring Frequency and Duty Cycle (See Figure 4)

- (1) Set rotary switch to Hz/% or V/uA/mA position:
- (2) Press Hz/% button to access frequency measurement;
- (3) Connect test leads to frequency signal source under test;
- (4) Read results on LCD:

SELECT Hurs.

Figure 1

# P/N:110401104707X

#### (5) Press Hz/% button again to access % measurement.

#### A Warnings:

- The measuring resolution will vary slightly based on frequency and waveform that have been input, and resolution for this meter is set with reference to sine wave.
- 5. Testing Diodes and Continuity(See Figure 5)
- (1) Set rotary switch to  $\Omega \rightarrow H$  position;
- (2) Press SELECT button to access diode measurement mode (repress to go into continuity testing);
- (3) Connect test leads to measured diode (red to anode, black to cathode), then LCD reading is approximate value for diode forward voltage drop (if resistance between two terminals of circuits under test is  $\leq 60 \Omega$ , the meter will beep and display resistance value on LCD). 2

#### A Warnings:

- If measured diode is under open circuit status or reversing the polarity (namely, black to anode, red to cathode), the meter displays "OL" on LCD.
- This function can also measure PN voltage drop of diode or semiconductor. The reading of forward voltage drop should be within 0.5∽0.8V for a normal silicon semiconductor.
- Turn the circuit power off and discharge the capacitor before measuring online diode so as to avoid meter damage.
- Do not input voltages above DC60V or AC 30Vrms to prevent damage to the meter or personal injury.

#### 6. Measuring Capacitance(See Figure 6)

- (1) Set rotary switch to  $\Omega \rightarrow H$  position: (2) Press SELECT button three times to
- access capacitance status;
- (3) Given there is still readings under open circuit, choose relative measurement mode:
- (4) Press REL button one time;
- (5) Connect test leads to capacitance under test, then read data on LCD.

# ∧ Warnings:

- Completely discharge all capacitors before measurement.
- As for online capacitor measurement, it must cut off all power supply of measured circuits and discharge completely all capacitors.
- When measuring capacitance with polarity distinction, ensure right connection between test leads and capacitor (red to anode, black to cathode).
- It normally takes several seconds to display readings when measuring more than 10µF capacitance.
- To avoid damage to the meter or personal injury do not apply voltages above DC60V or AC 30Vrms.

#### 7. Measuring DC & AC Current(See Figure 7.8)

- (1) Set rotary switch to "µA" or "mA" position, and press SELECT button to choose desired DC or AC range, then Connect test leads in series to measured loop.
- (2) Read current readings on LCD
- (3) It is RMS value displayed by UT120C when measuring AC current (Sine wave)

5

### A Warnings:

- (1) Cut off the current before connecting the meter to the loop otherwise spark hazard occurs
- (2) Please ensure right input terminals and functions are selected during measurement; start from higher range if not sure about current flow under test.
- (3) UT120C is not expected to measure current higher than 400mA. (4) Do not connect test leads in parallel to any circuit, otherwise it may burn internal fuse and damage the meter
- (5)Cut off the power supply and then disconnect test leads with circuits under test after finishing all operations, which is particularly important when measuring large current
